- ABSTRACT (추상) –

Abstract methods: An abstract method is defined (has a declaration part), not implemented (no execution part)
- An abstract class contains one or more abstract methods.
- Functions are delegated and implemented to child classes.
- A method of defining an action (method) in an abstract way, and re-defining it as needed where it is actually needed.

```
public abstract class className {
```

-

1   FINAL

final: The variables final value in which after, it cannot be changed.

- final class: inheritance is not possible (a string class and a Math class
- final method: an overriding method where alterations are not possible,
- final variable: value of the variable cannot be changed
- final static: used as "`static final type variableNames`". (To define something like PI or the speed of a specific vehicle
